Helping Your Overly or Under-Sensory Responsive Child Get to Sleep

Some children respond to their surroundings with more or less intensity than others. If the definition below sounds like your child, they may benefit from some special techniques to help them sleep.

Does your child have trouble with sensory processing?

Sensory processing is the ability to take in, filter, and respond appropriately to sensory input like touch, movement, vision, hearing, taste and smell. Problems with sensory processing can take many forms in children. Some children are overly sensitive. They are felt to be “sensory avoiding” or “sensory-defensive.” They feel bombarded by common experiences like touch, lights and sound. Some children are under-sensitive – “sensory-seeking” or “sensory under-responsive.” They seek intense stimulation, bashing and crashing around, and seem less aware of pain and touch. Other children have trouble using sensory inputs to plan and perform gross and fine motor tasks. This is called “dyspraxia,” or motor planning disorder. (Definition adapted from adoptmed.org)

Try some of these bedtime tips:

Bedtime routines

• Plan and keep consistent bedtime routines.
• Use visual aids. Place pictures of the bedtime routine up in the room.
• Read special age-appropriate bedtime books talking about the importance of sleep.
• Try this 10-minute relaxation technique as the last bedtime routine. Go into the bedroom to tuck your child in. Talk to them and remind them to calm their brain and body.
  • Play soothing music, dim the room lights and turn on fun holiday/festive lights or a lava lamp. These help distract your child.
  • For 5 minutes, quiet the brain by talking about favorite part of the day, or what good things to dream about.
  • For 5 minutes, quiet the body with no talking. Work on deep-breathing and have your child stay in bed to encourage sleep. Let your child know if they don’t quiet down then you will leave the room. (Don’t let them fall asleep while you are there. This establishes negative sleep association. They may wake up at night expecting you to be there.)

Soothing music, firm massage strokes and a weighted blanket can help your child fall asleep more easily.
Helping Your Overly or Under-Sensory Responsive Child Get to Sleep

The bedroom environment
Make sure your child’s sleep area is:
• Dark. Close the binds or pull down the dark window shade.
• Quiet.
• Has some type of background noise. A fan, air purifier or white noise machine running can be calming to some children.

In-bed use of massage and weights
• Massage your child’s back, arms or legs. Try calming scents like lavender or vanilla lotion. Use downward strokes and firm pressure for about 5 minutes. Do not use soft touch or touch on stomach (this can actually increase sensory problem).
• Use a weighted blanket. You can make your own. It needs to be 30% of child’s body weight. Sew pockets into any blanket and add small weighted bean bags.
• Fill a sock with dried beans and lay it over your child’s legs.
• Place warm towels from the dryer over your child’s legs.

Activities for your child to do 1 to 2 hours before bedtime
• Jump on a trampoline.
• Push and pull weighted objects (like the clothes hamper) around.
• Carry a weighted backpack on their back or have child sit and do an activity while you press down on their shoulders. You can also use a sock with dried beans in it and lay it over child’s shoulders.
• Walk on uneven cushions. This offers core work and balance.
• Do sensory input activity play. Play with Play-Doh, step with bare feet into sand or dry beans or just play with these textures. Push coins into a slit in a tennis ball.

Resources on the Web for more information

Free Interpreter Services
• In the hospital, ask your child’s nurse.
• From outside the hospital, call the toll-free Family Interpreting Line 1-866-583-1527. Tell the interpreter the name or extension you need.

Seattle Children’s offers interpreter services for Deaf, hard of hearing or non-English speaking patients, family members and legal representatives free of charge. Seattle Children’s will make this information available in alternate formats upon request. Call the Family Resource Center at 206-987-2201.

This handout has been reviewed by clinical staff at Seattle Children’s. However, your child’s needs are unique. Before you act or rely upon this information, please talk with your child’s healthcare provider.
