

Dr. Majesky is transforming stem cells into hope.

Renowned researcher Dr. Mark Majesky is now at Seattle Children's Research Institute, working with stem cells to develop lifesaving treatments that could someday replace invasive surgeries and transplants in children. His titles are impressive—Director of Myocardial Regeneration Initiative

Cure. at the Center for Tissue and Cell Sciences at the Research Institute, and Professor of Pediatrics at the University of Washington. His work is even

more impressive. "It's not very often that you see this level of commitment, energy and resources from donors, a research institute and a hospital," says Dr. Majesky. "The Institute is a rich, collaborative environment where researchers work together across benches to find cures." To learn more, visit seattlechildrens.org/research.
