

BAER and EOAE Under Anesthesia

Hearing tests done while your child sleeps

What kinds of hearing tests is my child having?

Your child is scheduled to have a Brainstem Auditory Evoked Response (BAER) test and an Evoked Otoacoustic Emissions (EOAE) test. These tests allow us to find out how your child hears without them having to respond to sounds. We use the BAER and EOAE hearing tests for babies under 6 months old and with older children whose hearing cannot be tested behaviorally in a sound booth.

How are these tests done?

These two tests are often done together. Because the measurements we are taking are sensitive to noise and movement, your child needs to be asleep during the tests. Children over 6 months of age who need these tests will need anesthesia. This allows the child to be in a deep enough sleep for us to get the best results.

These tests are done in our Outpatient Procedure Center. Your child will need other appointments before the day of the test to make sure they are healthy. We will help you make all of the appointments needed.

What happens the day of the test?

A parent or legal guardian with medical decision-making rights must come with the child having the test or be immediately available by phone to give verbal consent.

You will not be able to stay with your child during the test. The tests will last for about 1½ hours, and then your child will be taken to the recovery area. Your child will stay in the recovery area until they are awake and comfortable.

The audiologist will share the results of the tests and any recommendations with you on the day of the test.

About the BAER

After your child has fallen asleep, four sensors are placed on the skin behind the ears and on the forehead. A soft earphone is placed in the ear and different levels of click sounds and tones are given. The response of your child's ear to these special sounds is recorded and stored in a computer. We find the quietest level that your child's ear responds to.

About the EOAE

Otoacoustic emissions are tiny sound waves (echoes) produced by the inner ear in response to special sounds. Our ears cannot hear these echoes when they are produced. A sound will be presented to your child's ear through a
