

Wanted for Research Study

Kids with Diseases Affecting the Immune System

Researchers at Seattle Children's Hospital want to learn more about what causes diseases that affect the immune system. This research study is for people who have immune-mediated diseases, like arthritis, immunodeficiency, or colitis.

Interested?

You may participate in the study if you were diagnosed with a disease of the immune system before you were 21 years old

What happens in the research?

We will ask you for a blood sample. We may invite you to give us a urine, stool, saliva, or dental plaque sample, and extra tissue from a biopsy that you might have had. We will ask you to answer some questions on paper about your health history. We will invite your parents and other relatives to participate too. The visit will take about 40 minutes.
