

Healthy Children/Teens Wanted for Research Study

Researchers in the Center for Immunity and Immunotherapies at Seattle Children's Hospital want to learn more about what causes diseases of the immune system, like arthritis, immunodeficiency, and colitis.

In order to find out, we need to compare healthy children/teens with patients who have immune system diseases.

Interested?

You can participate in the study if:

- You are under 21 years old
- You are healthy (you do not have asthma, diabetes, arthritis, or other diseases of your immune system)

What happens in the research?

We will ask you for a blood sample. We may invite you to give us a urine, stool, saliva, or dental plaque sample. We will ask you to answer some questions on paper about your health history. We will invite your parents and other relatives to participate too. The visit will take about 40 minutes.
