Hypospadias Repair

Discharge instructions for home

Hypospadias repair is a surgery that lengthens the tube (urethra) from the bladder so that it comes out at the penis tip. If there is a bend in the penis (chordee), it will be straightened during the repair.

When may my child eat?

• When fully awake, your child may have clear liquids, like 7UP, Jell-O, Popsicles and apple juice.
• Nausea and throwing up (vomiting) are common after surgery. If this happens, give your child a small amount of clear liquids at a time.
• If your child is not sick to his stomach or throwing up and he is fully awake, your child may then start his regular diet.

How do I care for the surgery site?

• After the surgery, your child may have a dressing (bandage) on his penis.
• There will be a small, soft tube (catheter) in the penis, which will drain all of the urine.
• The area around the incision will be swollen and red. You may also notice some bruising, yellow crusting or scabbing. This will get better with time.
• Some oozing of blood is expected. If the dressing is soaked or the penis is bleeding, apply constant, gentle pressure for 5 minutes. If bleeding continues call the Seattle Children’s Emergency Room.
• Before and after the dressing is removed, put a moderate to large amount of petroleum jelly (Vaseline) all over your child’s penis with each diaper change (about 5 times per day) for at least 2 weeks.

How do I care for the dressing?

• This dressing helps to reduce the risk of bleeding and swelling after surgery.
• Sponge-bathe your child for the first 2 to 3 days after surgery. Then, your child can go back to normal bathing.
• If the dressing becomes dirty with stool (poop) after a bowel movement, it needs to be removed so the incision can be cleaned. Follow the steps below to remove the dressing.
• You will remove the dressing at home 2 to 3 days after surgery. Your surgeon will teach you how to do this.
• If the dressing gets dirty from stool or falls off early, do not replace it.

Tips for dressing removal

• Let your child sit in a warm bath for about 10 minutes. This can help loosen
the dressing and make it easier to remove. If the bandage is not loosening, have your child sit in the bath for another 10 to 20 minutes.

- If the dressing is still not coming off easily or seems to be stuck, apply 1 cup of oil (corn, vegetable, olive or baby oil) directly on the penis. Allow this to soak in for 20 minutes and then remove the dressing.
- If the dressing is still not coming off, call the urology office.

**How do I care for the catheter?**

- The catheter is held in place by a stitch at the tip of the penis. This will be removed in the urology clinic in 2 to 10 days.
- Pee (urine) will drip continuously from the catheter into a double diaper. We will show you how to double diaper before you go home.
- The catheter may have a cap on the end. Please make sure the cap is off and the catheter is draining into the diaper.
- If instructed to do so, cap the catheter while bathing your child.
- If urine is not draining and your child’s diaper is dry for 4 hours, make sure the catheter is not kinked. If urine is still not draining call the urology clinic.
- The urine may be light pink and you may see spots of blood in the diaper.

**How to double diaper**

- Your child will wear a normal sized diaper on the inside.
- On the outside, your child will wear a diaper 1 size larger.
- The catheter will drain into the outer diaper so the catheter does not get dirty if your child has a bowel movement.

**How much activity can my child do?**

- Your child should rest the day of surgery.
- Your child should avoid rough play, climbing, contact sports and straddle toys (bicycles, jumpers, etc.). A good rule for activity is to keep both feet on the ground at the same time for 2 to 3 weeks after surgery.

**Bowel movements**

- It is important for your child to have regular bowel movements after surgery.
- Some of the medicines your child may be taking (such as oxycodone and oxybutynin) can cause constipation.
- If your child is straining or has not had a bowel movement for 2 to 3 days after surgery, give plenty of water, juices, fruits or vegetables.
- If your child has not had a bowel movement for 3 days, call the urology office. We may prescribe a stool softener.
- Read the medicine prescriptions carefully so you do not confuse the oxycodone for pain and oxybutynin for bladder spasms.
- If your child has a bowel movement that gets on the incision, wash it off with water (do not use soap).

Free Interpreter Services
• In the hospital, ask your child’s nurse.
• From outside the hospital, call the toll-free Family Interpreting Line
  1-866-583-1527. Tell the interpreter the name or extension you need.

Will my child have pain?
• After a surgery your child will likely feel pain. We partner with you and your
  child to relieve pain as completely as possible. No matter the level of your
  child’s pain, believe they are hurting and respond right away. See our
• Your child may be prescribed acetaminophen (Tylenol), ibuprofen (Advil or
  Motrin) and oxycodone for pain. Instructions will be given on dosing and
  timing when you are getting ready to go home.
• In addition to medicine for pain, you can also help your child cope by
  distracting them with music, games, TV or videos.
• See our handout “Soothing Your Baby: In the Hospital and at Home”

What other medicines might my child need?
• Antibiotic: Your doctor may prescribe this to help prevent infection while
  the catheter is in place. This is stopped after the catheter is removed.
• Oxybutynin ( Ditropan): Your doctor may prescribe this to prevent bladder
  spasms. Bladder spasms are muscle cramps in the bladder caused by
  irritation from the catheter. Signs that your child may be having a bladder
  spasm are crying, pulling knees to the chest or urine leaking around the
  catheter. Do not give oxybutynin the day of the catheter removal.
• Stool softener: Your doctor may prescribe a stool softener to prevent or
  help with constipation.

When should I call a doctor?
If your child is having any problems, call the nurse in the Urology Clinic at 206-
987-2509 during the day. After 5 p.m. or on weekends, call 206-987-2000 and ask
the hospital operator for the urologist on-call.

Call us if your child has any of these warning signs:
• Fever higher than 101.5 F (38.6 C)
• Redness or swelling that spreads up into the stomach area
• A lot of bleeding that doesn’t stop after you apply pressure for 5 minutes
• Your child has pain not controlled by the medicine prescribed
• Cannot pee in 8 to 12 hours after surgery or urine if not draining from the
  catheter for more than 4 hours
• Vomiting
• The catheter comes out
