

Abdominal Breathing Exercises

Abdominal breathing is a way to breathe from your stomach area (abdomen) to fill your entire lungs with air. Your lungs are like balloons that should fill up and empty all the way. Your body gets the most benefit when you breathe using your entire lungs. Many people who are under stress breathe in short and shallow breaths from the chest, using the upper parts of the lung. Breathing only from your chest can increase muscle tension.

Abdominal breathing allows your muscles to relax and lets more oxygen in to energize your body. You can practice abdominal breathing when you are tense, anxious, low on energy or need to calm your mind. A few deep breaths from your stomach area can make a difference. It is important that you breathe from your abdomen when you are under stress. This will help reduce tension and anxiety.

Abdominal breathing

Lie down and put your hands on your stomach area. Breathe from your abdomen so that your hands go up when you breathe in and down when you breathe out. Focus on making your stomach go up and down at a regular rate. Make it smooth and easy. You can practice this anywhere.

Other breathing exercises:

Watch your breath

This is called mindfulness. Sit or lie in a comfortable position with your eyes closed. Focus your attention on your breathing, and do not try to change it. Watch it go in and out. If it changes, keep being aware of it, almost like you are watching someone else. This is a way to relax and balance your body and mind. This method can also work to decrease pain.

Focus on breathing out

Keep watching your breath, and do not try to change it. Think only of breathing out. When you push more air out, you will automatically take more air in. Breathe deeply and feel yourself relax.
