Inclusion Criteria
- ≥ 3 months with suspected anaphylaxis

Exclusion Criteria
- Blood transfusion reactions that are not anaphylaxis
- Symptoms clearly attributable to other causes

High clinical concern for anaphylaxis?
- NO
- YES

**Give epinephrine 0.01mg/kg IM (max 0.3mg) in lateral thigh**
- Repeat every 5 min as needed (can give more frequently if symptoms are severe)

- Place on monitors, vitals every 5 minutes
- Place patient supine if tolerated
- Avoid sudden changes in position, especially to standing
- Administer O2 until O2 Sat is known, and to keep O2 saturation > 90%

- If MAP <5th %ile → place IV and administer NS 20 cc/kg
- If bronchospasm → place IV and give albuterol 20 mg / hr or 8 puffs

**Observe for 5-10 mins**
- Continue monitoring with vitals every 5 minutes

Has patient improved?
- YES
- NO

**Go to**
- Lower Clinical Concern
- Mild
- Moderate - Severe

### Symptoms Suggestive of Anaphylaxis

**Mild Symptoms:**
- Generalized erythema, hives, angioedema

**Moderate Symptoms:**
- Chest or throat tightness
- Dyspnea, stridor, wheeze
- Nausea, vomiting, abdominal pain
- Dizziness (presyncope), diaphoresis

**Severe Symptoms:**
- Cyanosis, saturation <= 92%
- Hypotension, collapse
- Confusion, LOC
- Incontinence

**Risk Factors for Anaphylaxis**
- Possible exposure to known allergen
- Home anaphylaxis management plan

- Adapted from Brown, 2004

**Historical factors that increase risk and warrant a lower threshold for epinephrine:**
- Prior anaphylaxis involving respiratory distress
- Hypoxia
- Hypotension
- Neurologic compromise

- From Wang 2017
Lower clinical concern for anaphylaxis?

YES

Use the Anaphylaxis Score Assisting Providers (ASAP)

Score

1-4

Score

≥ 5

Rapid symptom progression or epinephrine indicated per patient action plan?

YES

Epinephrine is likely indicated. Huddle with team to discuss

• Give epinephrine 0.01mg/kg IM (max 0.3mg) in lateral thigh
• Repeat every 5 mins as needed (can give more frequently if symptoms are severe)

Has patient improved?

YES

Go to Mild

NO

Go to Moderate - Severe

NO

Go to Mild

Inclusion Criteria
≥ 3 months with suspected anaphylaxis

Exclusion Criteria
• Blood transfusion reactions that are not anaphylaxis
• Symptoms clearly attributable to other causes

Symptoms Suggestive of Anaphylaxis

Mild Symptoms:
• Generalized erythema, hives, angioedema

Moderate Symptoms:
• Chest or throat tightness
• Dyspnea, stridor, wheeze
• Nausea, vomiting, abdominal pain
• Dizziness (presyncope), diaphoresis

Severe Symptoms:
• Cyanosis, saturation ≤ 92%
• Hypotension, collapse
• Confusion, LOC
• Incontinence

Risk Factors for Anaphylaxis
• Possible exposure to known allergens
• Home anaphylaxis management plan

Adapted from Brown, 2004
Resolved after epinephrine or no epinephrine given

Inclusion Criteria

- ≥ 3 months with suspected anaphylaxis

Exclusion Criteria

- Blood transfusion reactions that are not anaphylaxis
- Symptoms clearly attributable to other causes

Use “ED Anaphylaxis Panel”

if patient has received epinephrine, or has cutaneous symptoms:

- Cetirizine PO
- H2 receptor blocker PO

Assess for risk factors

- History of biphasic or severe reaction
- History of asthma or wheezing
- Time from exposure to symptom onset delayed > 1 hour or unknown

Symptoms resolved AND risk factors absent

No steroids

Symptoms persist OR risk factors present

dexamethasone PO

Evaluate and score hourly and with symptom change

NOT worse or score 1-4

Go to ED Disposition

worse or score ≥5

Epinephrine is likely indicated. Huddle with team to discuss.

Go to Moderate - Severe

Steroids with immunotherapy
Score patient using **ASAP**

- **Inclusion Criteria**
  - ≥ 3 months with suspected anaphylaxis

- **Exclusion Criteria**
  - Blood transfusion reactions that are not anaphylaxis
  - Symptoms clearly attributable to other causes

Epinephrine has been given & observed for 5-10 mins → YES

Score patient using **ASAP**

- **Improved or score 1-4**
  - Give epinephrine 0.01mg/kg IM (max 0.3mg) in lateral thigh
  - Place IV (if not already done)
  - Cetirizine PO (unless unable to tolerate PO, then diphenhydramine IV)
  - H2 Blocker IV
  - MethylPrednisolone IV

- **NOT improved or score ≥5**
  - Use “ED Anaphylaxis Panel”

  - ! **Steroids with immunotherapy**

Observe for 5-10 min -continue monitoring, vitals every 5 minutes

- **Improved or score 1-4**
  - Go to **Mild**

- **NOT improved or score ≥5**
  - Go to **ED Disposition**

  - Consider epinephrine 0.01mg/kg IM (max 0.3mg) in lateral thigh
  - Repeat every 5 min as needed (can give more frequently if symptoms are severe)
  - Start epinephrine drip after 3rd IM dose
  - PICU consult, admit to PICU
**PICU Criteria**
- Persistent MAP <5% ile
- Altered mental status after 1 epinephrine
- > 3 doses of epinephrine given with persistent symptoms beyond rash/ angioedema
- Persistent cardiovascular compromise
- Persistent respiratory distress
- Continuous albuterol for > 1 hour

**Discharge Criteria**
- Score 1-4, no symptom progression during observation period
- Teaching completed
- Tolerating PO intake

**Discharge Instructions**
- Provide anaphylaxis discharge materials e.g., FARE Field Guide and Anaphylaxis Emergency Care Plan
- Rx epinephrine auto-injector and provide training
- RASH Hx, discharge with
  - Cetirizine pm
  - H2 receptor blocker PRN
  - x3 days
- No RASH Hx, discharge with no meds
- Recommend allergist referral
- F/U PCP within 3 days
Avoid sudden changes in position, especially to standing
Continuous monitoring CR and O2 sat
Vitals (BP, HR, RR) and skin check Q 1 hour
See above for symptoms of anaphylaxis

4 hours after epinephrine

CR and O2 sat monitoring
Vitals (BP, HR, RR) and skin check Q 2 hours
See above for symptoms of anaphylaxis

0-4 hours after epinephrine or symptom progression

If persistent wheezing without other anaphylaxis symptoms, evaluate for treatment of asthma (off pathway)

Be prepared for epinephrine administration – have acute anaphylaxis kit readily available (Omicell)

Discharge: For patients admitted with anaphylaxis

D/C Criteria
• >12 hours since last epinephrine
• Teaching completed
• PCP F/U arranged within 72 hours
• Allergist referral initiated
• Tolerating PO intake

If risk of allergen re-exposure:
FARE Field Guide and Anaphylaxis Emergency Care Plan in hand (full packets in ED or print from online) and filled out by provider

Discharge Epinephrine:
• Epi Auto-injector in hand (not sent to outside pharmacy) pharmacy to train in use; watch video on Get Well/FRC

Discharge Medications:
If persistent rash:
• Cetirizine PRN x3 days
• H2 receptor blocker PRN x3 days
If rash or wheezing:
• Prednisone x3 days

Symptoms Suggestive of Anaphylaxis
Mild Symptoms:
• Generalized erythema, hives, angioedema

Moderate Symptoms:
• Chest or throat tightness
• Dyspnea, stridor, wheeze
• Nausea, vomiting, abdominal pain
• Dizziness (presyncope), diaphoresis

Severe Symptoms:
• Cyanosis, saturation <= 92%
• Hypotension, collapse
• Confusion, LOC
• Incontinence

Use "Anaphylaxis for Inpatient" Panel
Patients to receive adjunctive medications below:
• Prednisone/prednisolone daily
• If persistent cutaneous symptoms:
  - Cetirizine PRN
  - H2 receptor blocker
PRN medications:
• Epinephrine 0.01mg/kg IM (max 0.3mg) in lateral thigh for anaphylaxis
• Albuterol 8 puffs for bronchospasm
• Ondansetron for nausea or vomiting

4–8 hours

O2 sat monitoring if respiratory symptoms
Routine Vitals and skin check Q 4 hours
See above for symptoms of anaphylaxis

8-16 hours

No epinephrine for 8 hours

Anaphylaxis v6.2: Inpatient Acute Onset

**Inclusion Criteria**
- ≥ 3 months with suspected anaphylaxis

**Exclusion Criteria**
- Blood transfusion reactions that are not anaphylaxis
- Symptoms clearly attributable to other causes

**Symptoms Suggestive of Anaphylaxis**

Mild Symptoms:
- Generalized erythema, hives, angioedema

Moderate Symptoms:
- Chest or throat tightness
- Dyspnea, stridor, wheeze
- Nausea, vomiting, abdominal pain
- Dizziness (presyncope), diaphoresis

Severe Symptoms:
- Cyanosis, saturation <= 92%
- Hypotension, collapse
- Confusion, LOC
- Incontinence

**Risk Factors for Anaphylaxis**
- Possible exposure to known allergen
- Home anaphylaxis management plan

Adapted from Brown, 2004

---

**Epinephrine should be Pre-ordered and readily available**
- High-risk medications with epinephrine in orderset
- Recent (~24h) exposure to known allergen
- Diagnosis of anaphylaxis this admission
- Home Rx for Epinephrine auto-injector
- Home anaphylaxis action plan

---

**Continue to observe for further signs and symptoms**

---

**Is epinephrine pre-ordered and readily available?**

- Yes
  - Stop Currently-Infusing Medications
  - Call Code Blue
  - Call RRT
  - Call provider with STAT page

- No
  - Give epinephrine 0.01mg/kg (max 0.3mg) intramuscularly (IM) in lateral thigh; repeat as needed
  - DO NOT DELAY WHILE WAITING FOR TEAM OR RRT TO ARRIVE

---

**Call Code Blue**

- Code Team to give IM epinephrine or providers can order/give epinephrine before they arrive

---

**Observe for 5-10 mins**

- Continue monitoring with vitals every 5 minutes

- Yes
  - Repeat epinephrine 0.01mg/kg (max 0.3mg) intramuscularly (IM) in lateral thigh
  - Plan for PICU transfer

---

**Yes**

- Place supine
- Provide O2 if sats < 90% or in distress
- **If MAP <5%** → place IV and administer N/S 20 cc/kg
- If bronchospasm → place IV and give albuterol 8 puffs

---

**No**

- If not already done, order one dose each of cetirizine + H2 receptor blocker IV/PO
- Go to the Inpatient Continued Management

---

**Anaphylaxis Resolved**

---

Last Updated: June 2021
Next Expected Review: August 2022
1. If the patient is clearly in anaphylaxis:
   GIVE EPINEPHRINE FIRST
   DO NOT WAIT TO SCORE THE PATIENT
2. Use the score:
   a) To aid in the diagnosis of anaphylaxis and need for epinephrine, for patients where the diagnosis is unclear.
   b) To obtain a symptom score, sometimes after treatment is initiated, in order to track symptom severity over time.

Actions based on Anaphylaxis Score:
SCORE 1 - 4 pt.  Acute anaphylaxis may still be developing. Routine use of epinephrine is not indicated, but may be appropriate if symptoms are recent and progressing rapidly, or if indicated per the patient’s anaphylaxis action plan. Place on monitors, observe closely in an environment with staff trained to monitor and treat for anaphylaxis, prepare to treat if needed.
SCORE ≥ 5 pts.  Acute anaphylaxis is very likely. In the appropriate clinical context, epinephrine is indicated.
This score is only a guide. The decision to give epinephrine is a clinical decision that may vary by patient.

Resolution of hypotension = Two blood pressure measurements obtained 15 minutes apart with MAP >10 %ile
Guidelines (i.e. Lieberman 2010) recommend that patients in anaphylaxis be placed supine, based on a pathology study that primarily involved adults:

Pathology series of 214 anaphylaxis deaths (including children)
- 38 anaphylactic shock deaths occurred outside hospital
- 10 had info on postural history
  - 4 died within seconds of a change to more upright posture
  - 6 died after they were propped in a sitting position after loss of consciousness
- Age not mentioned, none reported to be children

“During anaphylactic shock, the capacity of the veins and capillaries expands greatly. While a shocked person is lying down, sufficient blood might return to the vena cava to maintain a reduced circulation, but on the person’s sitting up or standing, this venous return stops; the vena cava will then become empty within seconds. There is then no flow through the right side of the heart, and within a few seconds more, no blood will return to the left side of the heart from the lungs. Pulseless electric activity continues, but in the absence of left ventricular filling there can be no contractions; this prevents coronary arterial flow and leads to myocardial ischemia. In less extreme cases, too, the coronary circulation, which is dependent on the diastolic pressure, is likely to become inadequate, because the blood pressure is the product of the cardiac output and the systemic vascular resistance, both of which are low in cases of anaphylactic shock. If this hypothesis is correct, once the vena cava is empty, epinephrine—no matter where or how it is given—could not circulate and so could not reverse the shock.”

Lieberman J Allergy Clin Imm 2010; Pumphrey J Allergy Clin Imm 2003
**Bronchospasm** or a bronchial spasm is a sudden constriction of the muscles in the walls of the bronchioles. It is caused by the release (degranulation) of substances from mast cells or basophils under the influence of anaphylatoxins. It causes difficulty in breathing which can be very mild to severe.

**Inflamed airways and bronchoconstriction in asthma.** Airways narrowed as a result of the inflammatory response cause wheezing.

Bronchospasms appear as the feature of asthma, chronic bronchitis and anaphylaxis.

Consider alternate diagnoses

Alternate diagnoses for the patients with mild symptoms:
- **Resp**: choking event, asthma
- **Cardiac**: vagal syncope, dehydration
- **GI**: gastroenteritis
- **Neurologic**: seizure, postural orthostatic tachycardia (POTS)
- **Infectious**: viral syndrome
- **Allergic**: simple hives, angioedema
- **Psychiatric**: psychogenic stridor, panic attack

Alternate diagnoses for patients with mod/severe symptoms:
- **Resp**: epiglottitis, foreign body aspiration, pulmonary embolism
- **Cardiac**: myocarditis, infarction, other heart disease
- **GI**: caustic ingestion, gastroenteritis
- **Neurologic**: seizure, stroke, increased ICP
- **Infectious**: sepsis, toxic shock syndrome
- **Toxicologic**: exposure (organophosphate) overdose (sedative-hypnotic, ACE inhibitor), scombroid poisoning
- **Psychiatric**: psychogenic stridor, panic attack
Before starting corticosteroids on a hematology/oncology patient, please contact the Hematology-Oncology team to see if there is a contraindication due to current therapy, such as immunotherapy.
What is a Biphasic reaction?

- A second wave of reaction after the first wave improved
- Estimated 15% of pediatric anaphylaxis

8 hours after exposure

4 hours after epi

Next morning

- Can be less severe, as severe or more severe than the initial reaction
- Up to 25% of fatal and near-fatal food reactions
- Most within 10 hours, reported up to 72 hours after the initial reaction
- If no biphasic reaction by ED discharge (3.5 - 6 hr observation), the chance after that is 4%

Observation

- How long to observe: 4 hours from latest of symptoms, epinephrine, any worsening

- Indications for Extended Observation
  - Severe reaction of slow onset
  - History of previous biphasic reaction
  - Marked asthmatic component
  - Slow response to treatment
  - Ingested antigen (continuous absorption)
  - Long distance from care
Evidence Ratings

This pathway was developed through local consensus based on published evidence and expert opinion as part of Clinical Standard Work at Seattle Children’s. Pathway teams include representatives from Medical, Subspecialty, and/or Surgical Services, Nursing, Pharmacy, Clinical Effectiveness, and other services as appropriate.

When possible, we used the GRADE method of rating evidence quality. Evidence is first assessed as to whether it is from randomized trial or cohort studies. The rating is then adjusted in the following manner (from: Guyatt G et al. J Clin Epidemiol. 2011;4:383-94.):

Quality ratings are downgraded if studies:
- Have serious limitations
- Have inconsistent results
- If evidence does not directly address clinical questions
- If estimates are imprecise OR
- If it is felt that there is substantial publication bias

Quality ratings are upgraded if it is felt that:
- The effect size is large
- If studies are designed in a way that confounding would likely underreport the magnitude of the effect OR
- If a dose-response gradient is evident

Guideline – Recommendation is from a published guideline that used methodology deemed acceptable by the team.

Expert Opinion – Our expert opinion is based on available evidence that does not meet GRADE criteria (for example, case-control studies).

Quality of Evidence:
- 💫💫💫💫 High quality
- 💫💫💫 Moderate quality
- 💫💫 Low quality
- 💫 Very low quality
Guideline
Expert Opinion
Summary of Version Changes

Version 1.0  (8/29/17): Go live
Version 1.1 (9/1/17): Administrative changes/edits
Version 2.0 (11/10/2017): Famotidine IV substituted for ranitidine IV; administrative changes/edits
Version 3.0 (3/9/2018): ASAP updated; administrative changes/edits
Version 4.0 (4/9/2018): MAP added to algorithm and administrative changes/edits
Version 5.0 (12/5/2018): Observe for 3 hours for patients meeting all “LIKE A ROSE” criteria
Version 6.0 (4/10/2020): Due to drug recall the medication ranitidine was removed from the pathway algorithm. A general statement about giving an oral H2 receptor blocker was added.
Version 6.2 (6/29/2021): Updated the algorithm to reflect the EPIC order panel name. Removed references to the CIS PowerPlan.

Retrieval Website: http://www.seattlechildrens.org/pdf/Anaphylaxis-pathway.pdf

Search Methods, *Anaphylaxis*, Clinical Standard Work

Studies were identified by searching electronic databases using search strategies developed and executed by a medical librarian, Jackie Morton. Searches were performed in November, 2016. The following databases were searched – on the Ovid platform: Medline, Cochrane Database of Systematic Reviews; Cochrane Central Register of Controlled Trials; elsewhere – Embase, National Guideline Clearinghouse, TRIP and Cincinnati Children’s Evidence-Based Care Guidelines. In Medline and Embase, appropriate Medical Subject Headings (MeSH) and Emtree headings were used respectively, along with text words, and the search strategy was adapted for other databases using their controlled vocabularies, where available, along with text words.

In Medline and Embase, appropriate Medical Subject Headings (MeSH) and Emtree headings were used respectively, along with text words, and the search strategy was adapted for other databases using their controlled vocabularies, where available, along with text words. The time frame searched for some clinical questions was 2006 to the date the search was conducted and included all levels of evidence currently in place for Clinical Effectiveness pathways. Some clinical questions were searched for 1996 to the date of the search and included all levels of evidence currently in place for Clinical Effectiveness pathways. Some clinical questions were searched for 2006 to the date of the search and have no levels of evidence applied. Concepts searched were the diagnosis, grading and treatment of anaphylaxis including the broader concept of hypersensitivities. The search strategy does not include the concept of severity or grade of acuteness; this is to be determined during the review process. All retrieval was limited to English language. The team added 38 citations not retrieved with the search strategy limitations.
